<b>About Pots:</b> We recommend the Bournes 250K pot (sold by Digkey) for the output control. The output pot is in the audio chain and the Bournes part is a high quality pot with a similar feel to our input attenuator. The shaft is a little too long so you will need to add an extra 3/8" between the pot and rear of the panel for the knob to sit flush. The panel holes are drilled for 3/8" bushings. Our input attenuator and the Bournes output have 3/8" bushings. The Alpha parts have 1/4" bushings so they sit loosely in the hole. This is not an issue as you can center them and tighten the nut.						
<b>About Terminal Blocks:</b> Terminal blocks can be used on the points where wires are connected to the main PCB. They are not required and they do have advantages and disadvantages. The main advantage is that since the wire is connected to the main PCB by a screw terminal block, wiring errors can be easily fixed. The disadvantage is that the screw terminal connection is not as secure as a solder joint.
